Debugging: `lw_synth_1d5D.py` would not run under `mpirun`

Ivan Milic — 2026-09-09 — host `ron.leibniz-kis.de`

Symptom. Launching the synthesis pipeline with `mpirun -n 128 python lw_synth_1d5D.py ...` failed immediately: every rank exited during start-up before any MPI work began.

Root cause. A recent (uncommitted) refactor merged the old `muram_binary_loader_sub()` into `muram_binary_loader(..., sub=True)` in `loaders.py` and rewrote the `__main__` block to use it, but left a stale top-level import in `lw_synth_1d5D.py`:

```
from loaders import muram_binary_loader_sub   # name no longer exists
```

Because it is a module-level import, it raises `ImportError` the instant the interpreter loads the file — on *all* ranks, before `MPI_Init`. `mpirun` therefore spawned 128 processes that each died on import; the job looked like an "MPI failure" but MPI was never the problem.

Fix. Removed the dead import line (line 34). No other code referenced the old symbol; the `sub=True` call path already in `__main__` is correct.

Verification.

- **MPI stack is sound.** The loaded module `mpi/openmpi-401_gcc-485` (Open MPI 4.0.1) and `mpi4py 3.1.5` in conda env `lw` (Python 3.12) are consistent: `ldd` shows `MPI....so` linked against the system `libmpi.so.40`, and `mpirun -n 4` reports ranks 0–3 of size 4 (not four size-1 singletons). OK.
- **End-to-end smoke test.** `mpirun -n 6 python lw_synth_1d5D.py /dat/milic/3D/3D_full_subdomain/ smoketest 0 False False muramsb`. Overseer loaded the MURAM sub-snapshot, flattened to $256 \times 256 = 65{,}536$ pixels / 2048 tasks (grain 32), and workers synthesised 105 pixels with zero errors before the test was stopped.
- **Timing.** First pixel per worker ≈38 s (one-time Lightweaver atom setup + Numba JIT), steady state ≈0.85 s/pixel thereafter — expected, not a bug.

Remaining caveats (not blocking, worth a look).

- `runmultiples*.sh` call the script with `<number> False muramsb` (3 args), but `__main__` now expects 6 positional args `path filename number stokes use_ne format`. The scripts need updating to the new signature (path first, snapshot number third).
- Hard-coded in `__main__`: loader region `[0,512,0,512,0,121]` with skip `2,2`, wavelength grid `460.0--461.5 nm`, and active species forced to `'Sr'` inside `synth()` regardless of the `actives` argument.
